

**CS213: Object Oriented Programming**  
**Assignment 3**

**Faculty of Computers and Artificial Intelligence**  
**Cairo University**

**CS213: Programming II**  
**Year 2023-2024**  
**First Semester**

**Assignment 3**

**Team Members:**

**Ahmad Yahia Hamada – 20220048**

**Saif El-Din Shady – 20220160**

**Ahmad Ismail Ali – 20220010**

**Work Breakdown Table:**

Pyramid XO Game	Ahmad Yahia Hamada - 20220048
Connect-4 Game	Saif El-Din Shady - 20220160
Five-by-five XO Game	Ahmad Ismail Ali - 20220010

## Quality Report:

The code review has shown the following:

- 1- The code is well-written, although complex.
- 2- Some methods are too long. Cases of this include:
  - a- The `int Board25::wins(char symbol)` method on line 189 of the implementation file, titled “full\_implementation.cpp”
  - b- The `PyramBoard::PyramBoard()` constructor method on line 69 of the implementation file, titled “full\_implementation.cpp”
- 3- The code’s performance is more than acceptable.
- 4- The code is formatted correctly using the Prettier extension offered by the Visual Studio Code IDE.
- 5- The code is not secure from risk due to the incomplete adaptation of the Random Player class, defined on line 67 of the header file, titled “board\_Game.hpp”.
- 6- The code deals safely with errors and validates invalid inputs by asking for them again.

<b>Requirements</b> <ul style="list-style-type: none"><li><input type="checkbox"/> Have the requirements been met?</li><li><input type="checkbox"/> Have stakeholder(s) approved the change?</li></ul>	<b>Code Formatting</b> <ul style="list-style-type: none"><li><input checked="" type="checkbox"/> Is the code formatted correctly?</li><li><input checked="" type="checkbox"/> Unnecessary whitespace removed?</li></ul>	<b>Best Practices</b> <ul style="list-style-type: none"><li><input type="checkbox"/> Follow Single Responsibility principle?</li><li><input type="checkbox"/> Are different errors handled correctly?</li><li><input checked="" type="checkbox"/> Are errors and warnings logged?</li><li><input type="checkbox"/> Magic values avoided?</li><li><input checked="" type="checkbox"/> No unnecessary comments?</li><li><input type="checkbox"/> Minimal nesting used?</li></ul>
<b>Maintainability</b> <ul style="list-style-type: none"><li><input checked="" type="checkbox"/> Is the code easy to read?</li><li><input checked="" type="checkbox"/> Is the code not repeated (DRY-Principle)?</li><li><input type="checkbox"/> Is the code method/class not too long?</li></ul>	<b>Performance</b> <ul style="list-style-type: none"><li><input checked="" type="checkbox"/> Is the code performance acceptable?</li></ul>	<b>Architecture</b> <ul style="list-style-type: none"><li><input checked="" type="checkbox"/> Is it secure/free from risk?</li><li><input type="checkbox"/> Are separations of concerned followed?</li><li><input checked="" type="checkbox"/> Relevant Parameters are configurable?</li><li><input type="checkbox"/> Feature switched if necessary?</li></ul>
<b>Testing</b> <ul style="list-style-type: none"><li><input checked="" type="checkbox"/> Do unit tests pass?</li><li><input checked="" type="checkbox"/> Do manual test plans pass?</li><li><input type="checkbox"/> Has been peer review tested?</li><li><input checked="" type="checkbox"/> Have edge cases been tested?</li><li><input checked="" type="checkbox"/> Are invalid inputs validated?</li><li><input type="checkbox"/> Are inputs sanitised?</li></ul>	<b>Documentation</b> <ul style="list-style-type: none"><li><input checked="" type="checkbox"/> Is there sufficient documentation?</li><li><input type="checkbox"/> Is the ReadMe.md file up to date?</li></ul>	<b>Other</b> <ul style="list-style-type: none"><li><input type="checkbox"/> Has the release been annotated (GA etc)?</li></ul>

## **Program Description:**

### **Classes:**

- Board class:
  - Houses the data structure which holds the boards of all games offered by the program.
  - Manages the board by variables for the numbers of rows and columns.
  - Holds virtual methods which are to be inherited by children classes to be adapted for each individual game.
- X\_O\_Board class:
  - 1<sup>st</sup> child of the previous class.
  - The first game offered by the program: Classical 3x3 Tic-tac-toe.
  - The game stops when one player has formed a three-in-a-row with their symbol, horizontally, vertically, or diagonally.
- PyramBoard class:
  - 2<sup>nd</sup> child of the Board class.
  - The second game offered by the program: Tic-tac-toe but on a pyramid board.
  - The game board is shaped like a pyramid. Five squares make the base, then three, then one. Players take turns marking Xs and Os as in traditional tic-tac-toe.
- Board42 class:
  - 3<sup>rd</sup> child of the Board class.
  - The third game offered by the program: Connect 4.
  - Seven columns of six squares each. Instead of dropping counters as in Connect Four, players mark the grid with Xs and Os as in tic-tac-toe.
- Board25 class:
  - 4<sup>th</sup> child of the Board class.
  - The fourth game offered by the program: 5x5 Tic-tac-toe.
  - Players take turns placing an X or an O in one of the squares until all the squares except one are filled.
  - The player with the higher number of three-in-a-rows wins. Sequences are counted horizontally, vertically, and diagonally. Two sequences overlapping is allowed.

- Player class:
  - Represents one player in the game.
  - Tasked with managing the player's information such as the player's name, their symbol, and the moves they make.
- Random Player class:
  - Child of the previous class.
  - Meant to represent a computer player, which makes random moves.

## **Methods:**

### **-Board class:**

1- Board(): Constructor for the board class.

2-void display\_board(): Displays the board, along with each square's index.  
No side effect.

3-bool is\_winner(): Not implemented, defined as virtual for children classes to inherit.

4- bool is\_draw(): Same as the above.

5-bool game\_is\_over(): Same as the above.

6-bool update\_board(int x, int y, char symbol): returns true and updates board if the submitted move is valid, otherwise prints an error message and doesn't update board.

### **-XOBoard class:**

1- bool is\_winner(): returns true when any player has a three-in-a-row sequence on the board.

2-bool is\_draw(): returns true if maximum turns have been played and there is no winner.

3-bool game\_is\_over(): returns true if maximum turns have been played.

### **-PyramBoard class:**

1-PyramBoard(): Constructor, constructs an empty board of one row of one, another row of three, and a final row of five.

2-bool is\_winner(): returns true when any player has a three-in-a-row sequence on the board.

3-bool is\_draw(): returns true if maximum turns have been played and there is no winner.

4-bool game\_is\_over(): returns true if maximum turns have been played.

5-int get\_num\_columns(int x): used for management due to different number of cells in every row.

#### -Board42 class:

1-bool is\_winner(): returns true when any player has a four-in-a-row sequence on the board.

4-bool is\_draw(): returns true if maximum turns have been played and there is no winner.

3-bool game\_is\_over(): returns true if maximum turns have been played.

5-bool update\_board(int x, int y, char symbol): returns true and updates board if the move is valid, otherwise returns false. Different from its parent's counterpart in the conditions of validity.

#### -Board25 class:

1-int wins(char symbol): Counts the number of three-in-a-rows of a single character on the board.

2-char winner(char c1, char c2): Wrapper for the above, returns the character with more three-in-a-rows.

#### -Player class:

1-Player(int order, char symbol): Constructor, assigns order and symbol to the player.

2-void get\_move(int x, int y): Stores the coordinates of the player's move.

3-string to\_string(): Getter for the player's name.

4-char get\_symbol(): Getter for the player's symbol.

-RandomPlayer class:

1-RandomPlayer(char symbol, int dd, int ee): Constructor, sets the players name and assigns new symbol.

2-void get\_move(int x, int y): Generates random move for the player and stores coordinates in variables x and y.

-GameManager class:

1-GameManager(Board \*, Player\*playerPtr[2]): Regular constructor, to store a pointer to a board type, or child-of-board type, variable and two pointers to a player type, or child-of-player type, variable.

2-GameManager(Board25, Player\*playerPtr[2]): Special constructor for the fourth game option, 5x5 Tic-tac-toe.

3-void run(): Runs the first three games, terminates when game is over and prints winner or draw.

4-void run25(): Runs the 5x5 tic-tac-toe game, terminates when max move count is met.
